

AIRCRAFT MATERIALS FOR CORROSION PREVENTION AND CONTROL: A QUALIFIED PRODUCTS LIST

John J. DeLuccia, Ph.D.
Air Vehicle and Crew Systems Technology Department (Code 606)
NAVAL AIR WARFARE CENTER
AIRCRAFT DIVISION WARMINSTER
P.O. Box 5152
Warminster, PA 18974-0591

September 1993

FINAL REPORT

FAA Interagency Agreement No. DTHA93-90-A700029

Approved for Public Release; Distribution is Unlimited.

Prepared for
Dr. Thomas Flournoy, ACD-210
DEPARTMENT OF TRANSPORTATION
FAA Technical Center
Atlantic City International Airport, NJ 08405

DTIC QUALITY INSPECTED 8

19970604 091

NOTICES

REPORT NUMBERING SYSTEM — The numbering of technical project reports issued by the Naval Air Warfare Center, Aircraft Division, Warminster is arranged for specific identification purposes. Each number consists of the Center acronym, the calendar year in which the number was assigned, the sequence number of the report within the specific calendar year, and the official 2-digit correspondence code of the Functional Department responsible for the report. For example: Report No. NAWCADWAR-92001-60 indicates the first Center report for the year 1992 and prepared by the Air Vehicle and Crew Systems Technology Department. The numerical codes are as follows:

CODE	OFFICE OR DEPARTMENT
00	Commanding Officer, NAWCADWAR
01	Technical Director, NAWCADWAR
05	Computer Department
10	AntiSubmarine Warfare Systems Department
20	Tactical Air Systems Department
30	Warfare Systems Analysis Department
50	Mission Avionics Technology Department
60	Air Vehicle & Crew Systems Technology Department
70	Systems & Software Technology Department
80	Engineering Support Group
90	Test & Evaluation Group

PRODUCT ENDORSEMENT — The discussion or instructions concerning commercial products herein do not constitute an endorsement by the Government nor do they convey or imply the license or right to use such products.

13. ABSTRACT (Maximum 200 words) This is a product list of materials for corrosion prevention and control that have been tested and are known to perform to the strict requirements of the military. This report was produced for the Federal Aviation Administration to be incorporated into their Advisory Circular on Corrosion Control for Aircraft, AC-43-4A, as chapter 8. Although written for civil aviation, the product information contained herein is valuable to all aircraft maintenance communities—both military and civilian. The products are grouped under the generic classes of materials: cleaners; sealants; and corrosion preventive compounds. Brief descriptions of the product classes relating to their function for corrosion prevention and/or control are given. Product lists, appropriately grouped, are given along with manufacturer's names and addresses.

CHAPTER 8

Aircraft Materials for Corrosion Prevention and Control:
A Qualified Products List

800. INTRODUCTION. Corrosion on aircraft can adversely affect airframes, avionics and propulsion systems. This narrative and list will deal primarily, though not exclusively, with those materials and products that affect airframes. The list reflects those products that have been shown to provide necessary and sufficient corrosion control properties as tested and deemed acceptable, thus, "qualified," by the U.S. military. The products are grouped under generic classes of materials, i.e. cleaners, coatings, sealants, and corrosion preventive compounds. Brief descriptions of the product classes relating to their function for corrosion prevention and/or control are given. Each class of material is followed by the list of qualified products pertaining to it and then by the product manufacturer's addresses. The FAA does not endorse the use of any particular product, nor does it guarantee that this is a complete list of all commercially available products. It is noted that products not appearing on this list are not necessarily unacceptable under all conditions. This is a product list of materials that have been tested and are known to perform to the stringent requirements of the U.S. military. Since the U.S. military flies and bases its aircraft in some of the most severe environments, the products listed are considered optimal for their intended use.

801. CLEANERS.

- (a) Aircraft Cleaning: The choice and frequency of external aircraft cleaning varies with the conditions of flight. Aircraft cleaning can be considered the first step in preventing corrosion. Cleaning requires a knowledge of the materials and methods needed to remove corrosive contaminants and fluids which tend to retain contaminants. Some reasons for regularly cleaning the external airframe and engines are:
- Prevents corrosion by removing salt deposits, other corrosive soils, and electrolytes.
 - Improves overall appearance.
 - Allows inspection for corrosion and corrosion damage.
 - Reduces fire hazards by removing accumulations of leaking fluids.
 - Ensures aerodynamic efficiency.
 - Maintains turbine engine efficiency.
- (b) Cleaning Compounds: Cleaning compounds work by dissolving soluble soils, emulsifying oily soils, and suspending solid soils. There are several types of cleaning compounds, each of which cleans a surface according to one or more specific needs.

The chart shown below gives an overall view of the three categories of cleaners in general use for airframes and engine gas paths.

AIRCRAFT CLEANING COMPOUNDS

NAWCADWAR-94099-60

- (1) Alkaline Cleaners: Highly alkaline cleaning compounds (pH greater than 10) are no longer authorized for Navy aircraft, due to incompatibility with polyimide airframe wiring insulation. Moderately alkaline cleaners (pH between 7.5 and 10), such as MIL-C-85570, are recommended for general airframe cleaning.

Recommended Types and Applications of MIL-C-85570:

Type I - General use aircraft exterior cleaner containing aromatic hydrocarbon solvent for removing heavily oxidized oils and greases. Should not be used without adequate ventilation. Normally diluted 1 part cleaner to 10 parts water (foam on, agitate, rinse off).

Type II - General use aircraft exterior cleaner containing no aromatic hydrocarbons for removing light oils, hydraulic fluids, and dirt. Can be used in areas of reduced ventilation (such as cockpits, cabins, bilges and equipment bays). Normally diluted 1 part cleaner to 10 parts water (foam on, agitate, rinse off).

Type III - Spot cleaner for high gloss paint for cleaning exhaust tracks. Used without dilution (rub on, rinse off).

Type V - Gel-type degreaser for cleaning wheel wells and replacement of some solvent cleaning where water rinsing can be tolerated. Used without dilution (spray on, let stand 5 -15 minutes, rinse off).

(The QPL for MIL-C-85570 is provided on pages 5 and 6 and the manufacturer's listing is on pages 7 through 12.)

- (2) Solvent Emulsion Cleaners (Aircraft Surface):

Due to its high solvent content, MIL-C-43616 (Cleaning Compound, Aircraft Surface) becomes an emulsion when diluted. The solvent contained in the cleaner softens oily soils so that they can be emulsified by the detergent and rinsed away. MIL-C-43616 contains foaming agents to facilitate application to vertical surfaces. Since most solvent emulsion cleaners can leave very thin oil or solvent films, another type of cleaner should be used prior to pretreating, painting, sealing, or bonding. Local air pollution regulations may restrict the amount and methods of application of these types of cleaners.

The QPL for MIL-C-43616 is provided on pages 13 and 14 and the manufacturer's listing is on pages 15 through 19.

- (3) Turbine Engine Gas-Path Cleaners: There are two cleaners recommended for use in engine gas paths; they are:

MIL-C-85704 Type I Solvent Based
MIL-C-85704 Type II Water Based

MIL-C-85704 is specially formulated to minimize aircraft turbine engine corrosion during wash cycles.

Because of its high solvent content, Type I behaves similarly to the solvent emulsion cleaners for aircraft surfaces, MIL-C-43616. The same considerations described for use of MIL-C-43616 apply to MIL-C-85704 Type I.

The newest version of this specification describes a solvent-free product designated Type II. Type IIA is a diluted version that is ready to use. Because they are solvent-free, these newest versions obviate some of the problems associated with pretreating, painting, sealing, or bonding directly after their use, and local air pollution requirements.

Type II has other advantages with respect to ease of application. Since it contains no solvent, it can be used while the engine is still hot; i.e., after a flight.

The QPL for MIL-C-85704 is provided on page 20 and the manufacturer's listing is on pages 21 through 23.

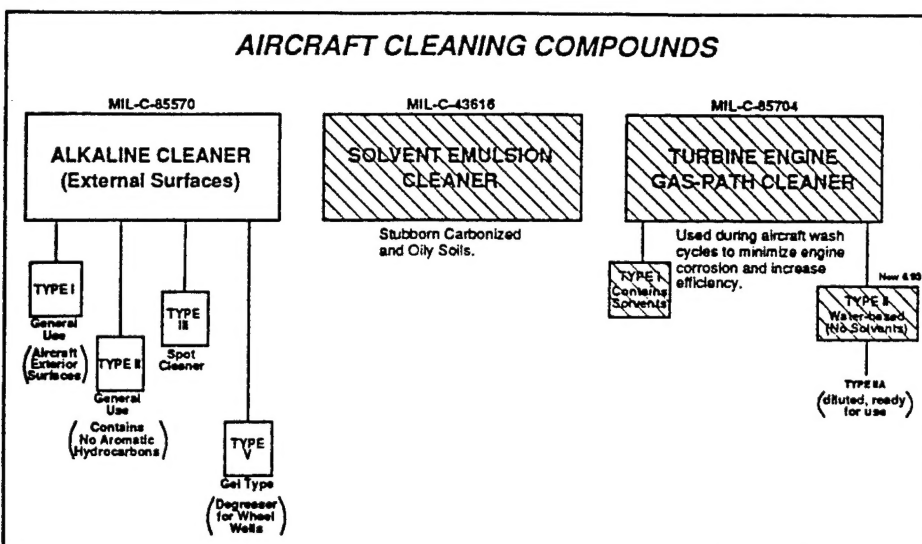

It should be noted that Type II presently has only two approved manufacturers. They are:

Turco Products Inc.
7300 Bols Avenue
Westminster, CA 92684-3600
(Products: Turco 6783-50
Turco 6783-410)

B&B Tritech Inc.
P.O. Box 660-176
Miami, FL 33266-0776
(Product: B&B TC-100)

Unless otherwise noted, the qualifying agency for these products is Code 6062, NAWCADWAR, Warminster PA, 18974.

The following are qualified lists for three cleaners that are in current military use and are recommended for general use on aircraft as ownership and warranties allow:

802. AIRCRAFT COATINGS.

- (a) As with aircraft cleaning, the choice and frequency of coating aircraft varies with flying conditions and aesthetic taste. All military aircraft are coated. Since the specified hydraulic fluid for military aircraft is different from that used in commercial aviation, the formulations of military coatings reflect this difference. Since these coatings would not be resistant to commercial hydraulic fluids, a qualified products list used by the military will not be presented here.

It should be realized that aircraft surface coatings provide the initial and sometimes the only protection of the part against corrosion. Normally when aircraft are painted, a primer, containing corrosion inhibitors, is applied first. The primer promotes adhesion and provides some corrosion protection. The topcoat provides a barrier to the environment and thus should be chemical as well as weather resistant. Typically, primers are usually epoxy based and top coats are usually polyurethanes. The toxic and flammable nature of paints, solvents and thinners must be considered when painting aircraft. With today's EPA restrictions on volatile organic compounds, (V.O.C.'s), and chromates, effective as inhibitors, new coatings that are waterborne and free of chromate inhibitors are coming into use. Self priming topcoats containing no chromates are already in use in the military.

803. SEALANTS.

- (a) Elastomeric sealants are widely used on naval aircraft to seal out the environment. The most popular at the present time are the polysulfide sealants that contain soluble corrosion inhibitors. These are covered by military specification MIL-S-81733. Ordinary polysulfide sealants (MIL-S-8802) can minimize corrosion of metals in high humidity environments, but cannot prevent it completely because all polymers are permeable to moisture. The inhibited sealant is very effective when used in faying surfaces and butt joints, for wet installation of fasteners and over fastener patterns and to insulate dissimilar metals. Both MIL-S-8802 and MIL-S-817733 are two component (part) systems. MIL-S-29574 is a new, two part type of fast cure aircraft sealant based on polythioether polymers. These sealants, used to seal aircraft fuel tanks, wings, doors and canopies, are excellent for repair since they cure in 4-5 hours, compared to 24 hours for the conventional polysulfide sealants. Another feature of the polythioether sealants is the 100°F higher temperature capability (up to 350°F) over polysulfide materials. Polythioether shows improved adhesion and has demonstrated its use for co-curing repair of graphite/epoxy composite aircraft components. The polythioether sealant polymer is also used in sprayable fuel tank coatings, and both corrosion inhibited and conductive aircraft sealants. All of the above two-part systems are resistant to aircraft hydraulic fluids. MIL-A-46146 is a one component (part) silicone based, room temperature vulcanization (RTV) sealant that has temperature capability to 400°F but is

not fluid resistant. Acetic acid curing RTVs are corrosive, do not meet MIL-A-46146 requirements, and are not recommended for use.

The following chart gives an overall view of the four sealants used for aircraft corrosion control. (CHART)

(b) Typical applications of sealants on aircraft are:

- Faying surface and seam sealing to minimize moisture intrusion,
- Wet installation of fasteners to minimize moisture intrusion,
- Fuel sealing (fuel tanks),
- Pressure area sealing (cabin areas),
- Weather sealing (exterior skin surfaces),
- Firewall sealing (engine areas),
- Electrical sealing (bulkhead wiring, electrical connectors and components),
- Acid-resistant sealing (battery compartments, lavatory tanks),
- Window sealing (windows),
- High temperature sealing (engine areas, anti-icing ducts, some electronics), and
- Aerodynamic sealing (exterior skin surfaces).

(c) Qualified product lists exist for MIL-S-8802 and MIL-S-81733 and are provided on pages 27, 28 and 30, respectively. The manufacturer's listings are on pages 29 and 31, respectively. The qualifying agency for MIL-S-8802 is the Air Force's Wright Laboratories, Dayton Ohio. The qualifying agency for MIL-S-81733 is the Naval Air Warfare Center, Aircraft Division, Warminster, PA. Both MIL-S-29574 and MIL-A-46146 do not have qualified lists but are purchased under first article inspection procedures. At present, the only known manufacturer of the fast cure polythioether covered under MIL-S-29574, is:

Courtaulds Aerospace
2820 Empire Avenue
Burbank, CA 91504

General Electric and Dow Corning Corp. are two suppliers of MIL-A-46146.

The following are lists of qualified products for two sealants that are in current military use and are recommended for use on aircraft as ownership and warranties allow:

804. CORROSION PREVENTIVE COMPOUNDS.

- (a) Corrosion preventive compounds (CPCs) or preservatives, are used to protect metal aircraft parts and components from corrosion on a temporary basis. These compounds can be separated into two major categories; water displacing and non-water displacing compounds. They may be used during manufacturing or storage of the component but more often they are used for operational preservation. Areas which are corrosion prone or where paint has been damaged should be routinely protected by CPCs until more permanent treatment can be applied (such as paint touchup or sealing). The use of CPCs provides a most effective yet underutilized tool in the prevention of corrosion on commercial aircraft.

A simplified chart of the corrosion preventative compounds that are in wide use for operational preservation of military aircraft is shown below.

805. DESCRIPTION OF CPCs.

- (b) Water displacing compounds. From the aforementioned chart; these compounds are covered under the military specifications of MIL-C-81309, an ultra-thin CPC that dries to a soft film, and MIL-C-85054, AMLGUARD, a CPC that dries to a hard clear finish. Both MIL-C-81309 and MIL-C-85054 contain effective corrosion inhibitors. These CPCs are able to penetrate into cracks, crevices, voids in faying edges, around fastener heads, and into hinges. They usually provide very thin coatings, one mil (0.001 inch) or less in thickness (a dollar bill is five mils thick), and are usually clear or translucent. Most water displacing compounds are soft, oily compounds which cannot provide long term protection outdoors or in areas which are frequently handled. AMLGUARD, MIL-C-85054, differs from these water displacing compounds by forming a relatively hard, dry film, and therefore can be used for protection outdoors and in areas of frequent handling. As is shown on the preceding chart, MIL-C-85054, commonly called AMLGUARD, should not be used on moving parts, such as threaded assemblies or hinges, since it dries to a hard, transparent finish. Although AMLGUARD appears to be permanent, it can be removed with any approved common solvent.
- (c) Non-water displacing compounds: MIL-C-16173 is a non-water displacing CPC. Grade 4 of MIL-C-16173 is in common use. It remains as a thick, light brown soft film. Although all three MIL SPEC CPCs shown in the chart contain corrosion inhibitors, the most effective corrosive inhibition is achieved with MIL-C-85054, AMLGUARD, which contains sulfonates and organic phosphate inhibitors.
- (d) Assessments/Suggestions: It is emphasized that the combination of water displacement with chemical inhibitors present in both MIL-C-81309 and MIL-C-85054, provides the best possible protection of any class of corro-

sion preventive compounds. Some commercial products that are widely available merely provide water displacement with little or no chemical inhibition. Other products, such as MIL-C-16173, provide a physical barrier and chemical inhibition but no water displacement. Thus it is strongly suggested that maintenance programs not only account for corrosion control but also actively utilize the best possible CPCs on their aircraft and use them in an expanded sense including the exterior surfaces (painted and unpainted) of airframes. It is noted that CPCs are routinely used on exterior airframe surfaces in the military but commercial transport aircraft maintenance programs have limited the use of CPCs to the interior corrosion prone areas. Observing the success of the U.S. military with such products as AMLGUARD, MIL-C-85054, utilized both internally and externally on aircraft (AMLGUARD has saved the U.S. Navy over \$50 million over a period of 9 years), it is obvious that a new dimension in corrosion control could and should be adopted by commercial aviation.

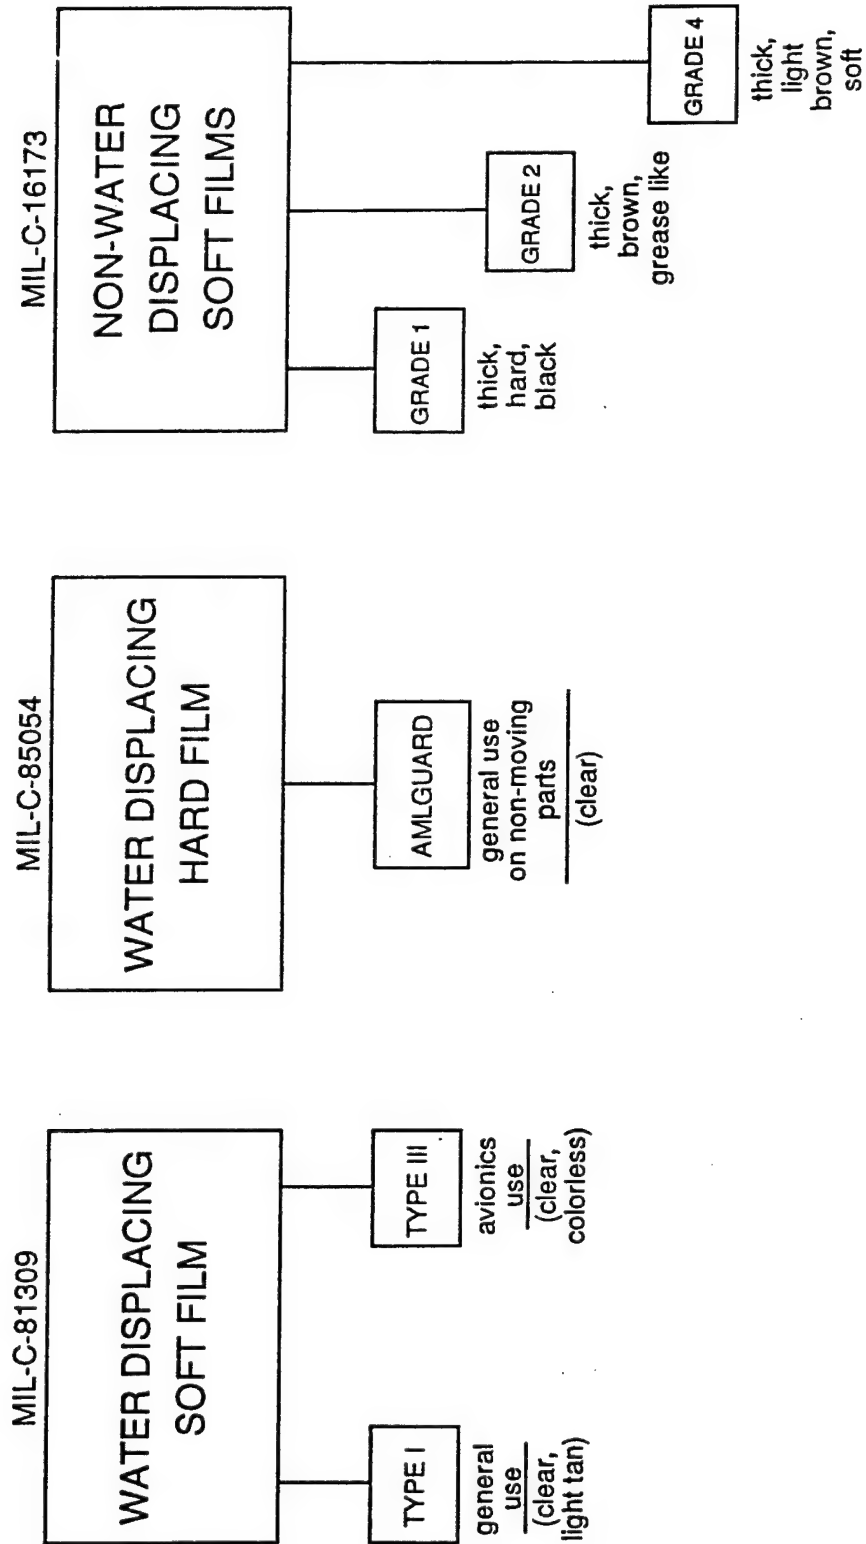

- (e) Qualified products lists exist for MIL-C-81309 and MIL-C-16173 and are provided on pages 35 through 37 and 46 through 48, respectively. The manufacturer's listings for these two CPCs are provided on pages 38 through 44 and 49 through 51, respectively. The qualifying agency for MIL-C-81309 is the Naval Air Warfare Center, A/C Division, Warminster, PA 18974. The qualifying agency for MIL-C-16173 is the Naval Sea Systems Command SEA-51222, Washington, DC 20362-5101. A qualified products list does not exist for MIL-C-85054. This material is procured under first article inspection procedures. At present, the only known manufacturer of a product covered under MIL-C-85054 is:

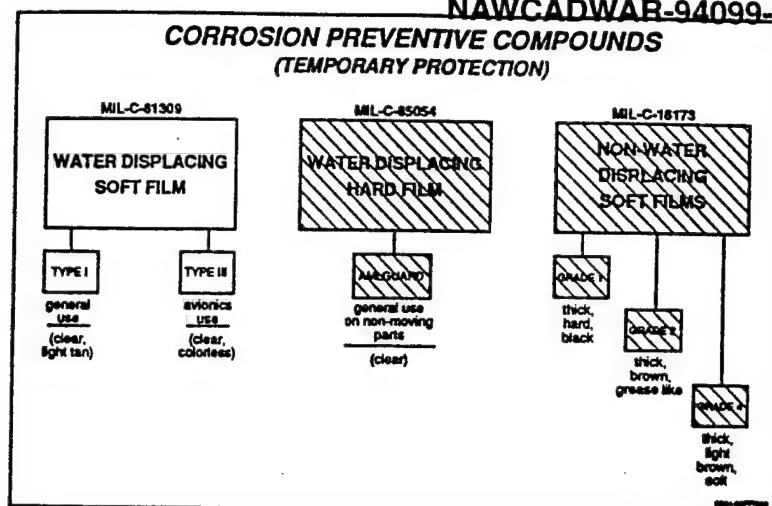

L.H.B. Industries
10440 Trenton Avenue
St. Louis, MO 63132

Any and all of the CPCs thus far discussed are recommended for use on aircraft surfaces as ownership and warranties allow. The following are lists of qualified products for MIL-C-81309 and MIL-C-16173 that are in current military use:

MIL-C-85054

PRODUCTS QUALIFIED UNDER MILITARY SPECIFICATION**MIL-C-85054****CORROSION PREVENTIVE COMPOUNDS, WATER DISPLACING,
HARD FILM**

A qualified products list does not exist for MIL-C-85054. This material is procured under first article inspection procedures. At present, the only known manufacturer of a product covered under MIL-C-85054 is:

L. H. B. Industries
10440 Trenton Avenue
St. Louis, MO 63132

QPL-16173-71
12 November 1991
SUPERSEDING
QPL-16173-70
16 October 1990

**QUALIFIED PRODUCTS LIST
OF
PRODUCTS QUALIFIED UNDER MILITARY SPECIFICATION
MIL-C-16173
CORROSION PREVENTIVE COMPOUND, SOLVENT CUTBACK,
COLD-APPLICATION**

This list has been prepared for use by or for the Government in the acquisition of products covered by the subject specification and such listing of a product is not intended to and does not connote endorsement of the product by the Department of Defense. All products listed herein have been qualified under the requirements for the product as specified in the latest effective issue of the applicable specification. This list is subject to change without notice; revision or amendment of this list will be issued as necessary. The listing of a product does not release the supplier from compliance with the specification requirements.
